# Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners. There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

## 1.1 Description

RISC-V CV32E20 32-bit processor model

## 1.2 Licensing

This Model is released under the Open Source Apache 2.0

#### 1.3 Extensions

#### 1.3.1 Extensions Enabled by Default

The model has the following architectural extensions enabled, and the corresponding bits in the misa CSR Extensions field will be set upon reset:

misa bit 2: extension C (compressed instructions)

misa bit 8: RV32I/RV64I/RV128I base integer instruction set

misa bit 12: extension M (integer multiply/divide instructions)

To specify features that can be dynamically enabled or disabled by writes to the misa register in addition to those listed above, use parameter "add\_Extensions\_mask". This is a string parameter containing the feature letters to add; for example, value "DV" indicates that double-precision floating point and the Vector Extension can be enabled or disabled by writes to the misa register, if supported on this variant. Parameter "sub\_Extensions\_mask" can be used to disable dynamic update of features in the same way.

Legacy parameter "misa\_Extensions\_mask" can also be used. This Uns32-valued parameter specifies all writable bits in the misa Extensions field, replacing any permitted bits defined in the base variant.

Note that any features that are indicated as present in the misa mask but absent in the misa will be ignored. See the next section.

#### 1.3.2 Enabling Other Extensions

The following extensions are supported by the model, but not enabled by default in this variant:

misa bit 4: RV32E base integer instruction set (embedded)

To add features from this list to the visible set in the misa register, use parameter "add\_Extensions". This is a string containing identification letters of features to enable; for example, value "DV" indicates that double-precision floating point and the Vector Extension should be enabled, if they are currently absent and are available on this variant.

Legacy parameter "misa\_Extensions" can also be used. This Uns32-valued parameter specifies the reset value for the misa CSR Extensions field, replacing any permitted bits defined in the base variant.

To add features from this list to the implicitly-enabled set (not visible in the misa register), use parameter "add\_implicit\_Extensions". This is a string parameter in the same format as the "add\_Extensions" parameter described above.

#### 1.3.3 Disabling Extensions

The following extensions are enabled by default in the model and can be disabled:

misa bit 2: extension C (compressed instructions)

misa bit 12: extension M (integer multiply/divide instructions)

To disable features that are enabled by default, use parameter "sub\_Extensions". This is a string containing identification letters of features to disable; for example, value "DF" indicates that double-precision and single-precision floating point extensions should be disabled, if they are enabled by default on this variant.

To remove features from this list from the implicitly-enabled set (not visible in the misa register), use parameter "sub\_implicit\_Extensions". This is a string parameter in the same format as the "sub\_Extensions" parameter described above.

### 1.4 General Features

#### 1.4.1 mtvec CSR

On this variant, the Machine trap-vector base-address register (mtvec) is writable. It can instead be configured as read-only using parameter "mtvec\_is\_ro".

Values written to "mtvec" are masked using the value 0xffffff00. A different mask of writable bits may be specified using parameter "mtvec\_mask" if required. In addition, when Vectored interrupt mode is enabled, parameter "tvec\_align" may be used to specify additional hardware-enforced base address alignment. In this variant, "tvec\_align" defaults to 256.

If parameter "mtvec\_sext" is True, values written to "mtvec" are sign-extended from the most-significant writable bit. In this variant, "mtvec\_sext" is False, indicating that "mtvec" is not sign-extended.

The initial value of "mtvec" is 0x1. A different value may be specified using parameter "mtvec" if required.

#### 1.4.2 Reset

On reset, the model will restart at address 0x0. A different reset address may be specified using parameter "reset\_address" or applied using optional input port "reset\_addr" if required.

#### 1.4.3 NMI

On an NMI, the model will restart at address 0x0; a different NMI address may be specified using parameter "nmi\_address" or applied using optional input port "nmi\_addr" if required. The cause reported on an NMI is 0x8000001f by default; a different cause may be specified using parameter "ecode\_nmi" or applied using optional input port "nmi\_cause" if required.

If parameter "rnmi\_version" is not "none", resumable NMIs are supported, managed by additional CSRs "mnscratch", "mnepc", "mncause" and "mnstatus", following the indicated version of the Resumable NMI extension proposal. In this variant, "rnmi\_version" is "none".

The NMI input is latched on the rising edge of the NMI signal. To instead specify that NMI input is level-sensitive, set parameter "nmi\_is\_latched" to False.

#### 1.4.4 WFI

WFI will halt the processor until an interrupt occurs. It can instead be configured as a NOP using parameter "wfi\_is\_nop". WFI timeout wait is implemented with a time limit of 0 (i.e. WFI causes an Illegal Instruction trap in Supervisor mode when mstatus.TW=1).

#### 1.4.5 time CSR

The "time" CSR is not implemented in this variant and reads of it will cause Illegal Instruction traps. Set parameter "time\_undefined" to False to instead specify that "time" is implemented.

#### 1.4.6 mcycle CSR

The "mcycle" CSR is implemented in this variant. Set parameter "mcycle\_undefined" to True to instead specify that "mcycle" is unimplemented and accesses should cause Illegal Instruction traps.

#### 1.4.7 minstret CSR

The "minstret" CSR is implemented in this variant. Set parameter "minstret\_undefined" to True to instead specify that "minstret" is unimplemented and accesses should cause Illegal Instruction traps.

### 1.4.8 mhpmcounter CSR

The "mhpmcounter" CSRs are implemented in this variant. Set parameter "mhpmcounter\_undefined" to True to instead specify that "mhpmcounter" CSRs are unimplemented and accesses should cause Illegal Instruction traps.

#### 1.4.9 Unaligned Accesses

Unaligned memory accesses are supported by this variant. Set parameter "unaligned" to "F" to disable such accesses.

Address misaligned exceptions are higher priority than page fault or access fault exceptions on this variant. Set parameter "unaligned\_low\_pri" to "T" to specify that they are lower priority instead.

#### 1.4.10 PMP

A PMP unit is not implemented by this variant. Set parameter "PMP\_registers" to indicate that the unit should be implemented with that number of PMP entries.

Accesses to unimplemented PMP registers cause Illegal Instruction exceptions on this variant. Set parameter "PMP\_undefined" to False to indicate that these registers are hard-wired to zero instead.

## 1.5 Compressed Extension

Standard compressed instructions are present in this variant. Legacy compressed extension features may also be configured using parameters described below. Use parameter "compress\_version" to enable more recent compressed extension features if required. See the following sections for detailed information about differences between each supported version.

### 1.5.1 Compressed Extension Parameters

Parameter "Zcea\_version" is used to specify the version of Zcea instructions present. By default, "Zcea\_version" is set to "none" in this variant. Updates to this parameter require a commercial product license.

Parameter "Zceb\_version" is used to specify the version of Zceb instructions present. By default, "Zceb\_version" is set to "none" in this variant. Updates to this parameter require a commercial product license.

Parameter "Zcee\_version" is used to specify the version of Zcee instructions present. By default, "Zcee\_version" is set to "none" in this variant. Updates to this parameter require a commercial product license.

#### 1.5.2 Legacy Version 1.10

Legacy encodings with version specified using Zeea, Zeeb and Zeee parameters.

#### 1.5.3 Version 0.70.1

All instruction encodings changed from legacy version, with instructions divided into Zca, Zcf, Zcb, Zcmb, Zcmp, Zcmpe and Zcmt subsets.

#### 1.5.4 Version 0.70.5

Version 0.70.5, with these changes compared to version 0.70.1:

- access to jt and jalt instructions is enabled by Smstateen.
- jvt.base is WARL and fewer bits than the maximum can be implemented

#### 1.5.5 Version 1.0.0-RC5.7

Version 1.0.0-RC5.7, with these changes compared to version 0.70.5:

- encodings of jt and jalt instructions changed.
- Zcmb and Zcmpe subsets removed.

## 1.6 Privileged Architecture

This variant implements the Privileged Architecture with version specified in the References section of this document. Note that parameter "priv\_version" can be used to select the required architecture version; see the following sections for detailed information about differences between each supported version.

#### 1.6.1 Legacy Version 1.10

1.10 version of May 7 2017.

#### 1.6.2 Version 20190608

Stable 1.11 version of June 8 2019, with these changes compared to version 1.10:

- mcountinhibit CSR defined;
- pages are never executable in Supervisor mode if page table entry U bit is 1;
- mstatus.TW is writable if any lower-level privilege mode is implemented (previously, it was just if Supervisor mode was implemented);

#### 1.6.3 Version 20211203

- 1.12 draft version of December 3 2021, with these changes compared to version 20190608:
- mstatush, mseccfg, mseccfgh, menvcfg, menvcfgh, senvcfg, henvcfgh and mconfigptr CSRs defined;
- xret instructions clear mstatus.MPRV when leaving Machine mode if new mode is less privileged than M-mode;
- maximum number of PMP registers increased to 64;
- data endian is now configurable.

#### 1.6.4 Version 1.12

Official 1.12 version, identical to 20211203.

#### 1.6.5 Version master

Unstable master version, currently identical to 1.12.

## 1.7 Unprivileged Architecture

This variant implements the Unprivileged Architecture with version specified in the References section of this document. Note that parameter "user\_version" can be used to select the required architecture version; see the following sections for detailed information about differences between each supported version.

#### 1.7.1 Legacy Version 2.2

2.2 version of May 7 2017.

#### 1.7.2 Version 20191213

Stable 20191213-Base-Ratified version of December 13 2019, with these changes compared to version 2.2:

- floating point fmin/fmax instruction behavior modified to comply with IEEE 754-201x.
- numerous other optional behaviors can be separately enabled using Z-prefixed parameters.

#### 1.8 Other Extensions

Other extensions that can be configured are described in this section.

#### 1.8.1 Zmmul

Parameter "Zmmul" is 0 on this variant, meaning that all multiply and divide instructions are implemented. if "Zmmul" is set to 1 then multiply instructions are implemented but divide and remainder instructions are not implemented.

#### 1.8.2 Zicsr

Parameter "Zicsr" is 1 on this variant, meaning that standard CSRs and CSR access instructions are implemented. if "Zicsr" is set to 0 then standard CSRs and CSR access instructions are not implemented and an alternative scheme must be provided as a processor extension.

#### 1.8.3 Zifencei

Parameter "Zifencei" is 1 on this variant, meaning that the fence.i instruction is implemented (but treated as a NOP by the model). if "Zifencei" is set to 0 then the fence.i instruction is not implemented.

#### 1.8.4 **Zicbom**

Parameter "Zicbom" is 0 on this variant, meaning that code block management instructions are undefined. if "Zicbom" is set to 1 then code block management instructions cbo.clean, cbo.flush and cbo.inval are defined.

If Zicbom is present, the cache block size is given by parameter "cmomp\_bytes". The instructions may cause traps if used illegally but otherwise are NOPs in this model.

#### 1.8.5 **Zicbop**

Parameter "Zicbop" is 0 on this variant, meaning that prefetch instructions are undefined. if "Zicbop" is set to 1 then prefetch instructions prefetch.i, prefetch.r and prefetch.w are defined (but behave as NOPs in this model).

#### 1.8.6 Zicboz

Parameter "Zicboz" is 0 on this variant, meaning that the cbo.zero instruction is undefined. if "Zicboz" is set to 1 then the cbo.zero instruction is defined.

If Zicboz is present, the cache block size is given by parameter "cmoz\_bytes".

#### 1.8.7 Smstateen

Parameter "Smstateen" is 0 on this variant, meaning that state enable CSRs are undefined. if "Smstateen" is set to 1 then state enable CSRs are defined.

Within the state enable CSRs, only bit 1 (for Zfinx), bit 57 (for xcontext CSR access), bit 62 (for xenvcfg CSR access) and bit 63 (for lower-level state enable CSR access) are currently implemented.

#### 1.9 CLIC

The model can be configured to implement a Core Local Interrupt Controller (CLIC) using parameter "CLICLEVELS"; when non-zero, the CLIC is present with the specified number of interrupt levels (2-256), as described in the RISC-V Core-Local Interrupt Controller specification, and further parameters are made available to configure other aspects of the CLIC. "CLICLEVELS" is zero in this variant, indicating that a CLIC is not implemented.

## 1.10 Interrupts

The "reset" port is an active-high reset input. The processor is halted when "reset" goes high and resumes execution from the reset address specified using the "reset\_address" parameter or "reset\_addr" port when the signal goes low. The "mcause" register is cleared to zero.

The "nmi" port is an active-high NMI input. The processor resumes execution from the address specified using the "nmi\_address" parameter or "nmi\_addr" port when the NMI signal goes high. The "mcause" register is cleared to zero.

All other interrupt ports are active high. For each implemented privileged execution level, there are by default input ports for software interrupt, timer interrupt and external interrupt; for example, for Machine mode, these are called "MSWInterrupt", "MTimerInterrupt" and "MExternalInterrupt", respectively. When the N extension is implemented, ports are also present for User mode. Parameter "unimp\_int\_mask" allows the default behavior to be changed to exclude certain interrupt ports. The parameter value is a mask in the same format as the "mip" CSR; any interrupt corresponding to a non-zero bit in this mask will be removed from the processor and read as zero in "mip", "mie" and "mideleg" CSRs (and Supervisor and User mode equivalents if implemented).

Parameter "external\_int\_id" can be used to enable extra interrupt ID input ports on each hart. If the parameter is True then when an external interrupt is applied the value on the ID port is sampled and used to fill the Exception Code field in the "mcause" CSR (or the equivalent CSR for other execution levels). For Machine mode, the extra interrupt ID port is called "MExternalInterruptID".

The "deferint" port is an active-high artifact input that, when written to 1, prevents any pendingand-enabled interrupt being taken (normally, such an interrupt would be taken on the next instruction after it becomes pending-and-enabled). The purpose of this signal is to enable alignment with hardware models in step-and-compare usage.

## 1.11 Debug Mode

The model can be configured to implement Debug mode using parameter "debug\_mode". This implements features described in Chapter 4 of the RISC-V External Debug Support specification with version specified by parameter "debug\_version" (see References). Some aspects of this mode are not defined in the specification because they are implementation-specific; the model provides infrastructure to allow implementation of a Debug Module using a custom harness. Features added are described below.

Parameter "debug\_mode" can be used to specify three different behaviors, as follows:

- 1. If set to value "vector", then operations that would cause entry to Debug mode result in the processor jumping to the address specified by the "debug\_address" parameter. It will execute at this address, in Debug mode, until a "dret" instruction causes return to non-Debug mode. Any exception generated during this execution will cause a jump to the address specified by the "dexc\_address" parameter.
- 2. If set to value "interrupt", then operations that would cause entry to Debug mode result in the processor simulation call (e.g. opProcessorSimulate) returning, with a stop reason of OP\_SR\_INTERRUPT. In this usage scenario, the Debug Module is implemented in the simulation harness.
- 3. If set to value "halt", then operations that would cause entry to Debug mode result in the processor halting. Depending on the simulation environment, this might cause a return from the simulation call with a stop reason of OP\_SR\_HALT, or debug mode might be implemented by another platform component which then restarts the debugged processor again.

#### 1.11.1 Debug State Entry

The specification does not define how Debug mode is implemented. In this model, Debug mode is enabled by a Boolean pseudo-register, "DM". When "DM" is True, the processor is in Debug mode. When "DM" is False, mode is defined by "mstatus" in the usual way.

Entry to Debug mode can be performed in any of these ways:

- 1. By writing True to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate), dcsr cause will be reported as trigger;
- 2. By writing a 1 then 0 to net "haltreq" (using opNetWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 3. By writing a 1 to net "resethaltreq" (using opNetWrite) while the "reset" signal undergoes a negedge transition, followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 4. By executing an "ebreak" instruction when Debug mode entry for the current processor mode is enabled by dcsr.ebreakm, dcsr.ebreaks or dcsr.ebreaku.

In all cases, the processor will save required state in "dpc" and "dcsr" and then perform actions described above, depending in the value of the "debug\_mode" parameter.

#### 1.11.2 Debug State Exit

Exit from Debug mode can be performed in any of these ways:

- 1. By writing False to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 2. By executing an "dret" instruction when Debug mode.

In both cases, the processor will perform the steps described in section 4.6 (Resume) of the Debug specification.

#### 1.11.3 Debug Registers

When Debug mode is enabled, registers "dcsr", "dpc", "dscratch0" and "dscratch1" are implemented as described in the specification. These may be manipulated externally by a Debug Module using opProcessorRegRead or opProcessorRegWrite; for example, the Debug Module could write "dcsr" to enable "ebreak" instruction behavior as described above, or read and write "dpc" to emulate stepping over an "ebreak" instruction prior to resumption from Debug mode.

#### 1.11.4 Debug Mode Execution

The specification allows execution of code fragments in Debug mode. A Debug Module implementation can cause execution in Debug mode by the following steps:

- 1. Write the address of a Program Buffer to the program counter using opProcessorPCSet;
- 2. If "debug\_mode" is set to "halt", write 0 to pseudo-register "DMStall" (to leave halted state);

3. If entry to Debug mode was handled by exiting the simulation callback, call opProcessorSimulate or opRootModuleSimulate to resume simulation.

Debug mode will be re-entered in these cases:

- 1. By execution of an "ebreak" instruction; or:
- 2. By execution of an instruction that causes an exception.

In both cases, the processor will either jump to the debug exception address, or return control immediately to the harness, with stopReason of OP\_SR\_INTERRUPT, or perform a halt, depending on the value of the "debug\_mode" parameter.

#### 1.11.5 Debug Single Step

When in Debug mode, the processor or harness can cause a single instruction to be executed on return from that mode by setting dcsr.step. After one non-Debug-mode instruction has been executed, control will be returned to the harness. The processor will remain in single-step mode until dcsr.step is cleared.

#### 1.11.6 Debug Event Priorities

The model supports two different models for determining which debug exception occurs when multiple debug events are pending:

1: original mode (when parameter "debug\_priority"="original");

2: modified mode, as described in Debug Specification pull request 693 (when parameter "debug-priority"="PR693"). This mode resolves some anomalous behavior of the original specification.

#### 1.11.7 Debug Ports

Port "DM" is an output signal that indicates whether the processor is in Debug mode

Port "haltreq" is a rising-edge-triggered signal that triggers entry to Debug mode (see above).

Port "resethaltreq" is a level-sensitive signal that triggers entry to Debug mode after reset (see above).

## 1.12 Trigger Module

This model is configured with a trigger module, implementing a subset of the behavior described in Chapter 5 of the RISC-V External Debug Support specification with version specified by parameter "debug\_version" (see References).

#### 1.12.1 Trigger Module Restrictions

The model currently supports tdata1 of type 0, type 2 (mcontrol), type 3 (icount), type 4 (itrigger), type 5 (etrigger) and type 6 (mcontrol6). icount triggers are implemented for a single instruction only, with count hard-wired to 1 and automatic zeroing of mode bits when the trigger fires.

#### 1.12.2 Trigger Module Parameters

Parameter "trigger\_num" is used to specify the number of implemented triggers. In this variant, "trigger\_num" is 1.

Parameter "tinfo" is used to specify the value of the read-only "tinfo" register, which indicates the trigger types supported. In this variant, "tinfo" is 0x02.

Parameter "trigger\_match" is used to specify the legal "match" values for triggers of types 2 and 6. This parameter is a bitmask with 1 bits corresponding to legal values; for example, a "trigger\_match" of 0xd, means that triggers of types 0, 2 and 3 are supported. In this variant, "trigger\_match" is 0xffff.

Parameter "tinfo\_undefined" is used to specify whether the "tinfo" register is undefined, in which case reads of it trap to Machine mode. In this variant, "tinfo\_undefined" is 0.

Parameter "tcontrol\_undefined" is used to specify whether the "tcontrol" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "tcontrol\_undefined" is 1.

Parameter "mcontext\_undefined" is used to specify whether the "mcontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "mcontext\_undefined" is 0.

Parameter "scontext\_undefined" is used to specify whether the "scontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "scontext\_undefined" is 0.

Parameter "amo\_trigger" is used to specify whether load/store triggers are activated for AMO instructions. In this variant, "amo\_trigger" is 0.

Parameter "no\_hit" is used to specify whether the "hit" bit in tdata1 is unimplemented. In this variant, "no\_hit" is 1.

Parameter "mcontext\_bits" is used to specify the number of writable bits in the "mcontext" register. In this variant, "mcontext\_bits" is 0.

Parameter "mvalue\_bits" is used to specify the number of writable bits in the "mvalue" field in "textra32"/"textra64" registers; if zero, the "mselect" field is tied to zero. In this variant, "mvalue\_bits" is 0.

Parameter "mcontrol\_maskmax" is used to specify the value of field "maskmax" in the "mcontrol" register. In this variant, "mcontrol\_maskmax" is 0.

## 1.13 Debug Mask

It is possible to enable model debug messages in various categories. This can be done statically using the "debugflags" parameter, or dynamically using the "debugflags" command. Enabled messages

are specified using a bitmask value, as follows:

Value 0x002: enable debugging of PMP and virtual memory state;

Value 0x004: enable debugging of interrupt state.

All other bits in the debug bitmask are reserved and must not be set to non-zero values.

## 1.14 Integration Support

This model implements a number of non-architectural pseudo-registers and other features to facilitate integration.

### 1.14.1 CSR Register External Implementation

If parameter "enable\_CSR\_bus" is True, an artifact 16-bit bus "CSR" is enabled. Slave callbacks installed on this bus can be used to implement modified CSR behavior (use opBusSlaveNew or icmMapExternalMemory, depending on the client API). A CSR with index 0xABC is mapped on the bus at address 0xABC0; as a concrete example, implementing CSR "time" (number 0xC01) externally requires installation of callbacks at address 0xC010 on the CSR bus.

#### 1.15 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. fence.i) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous. Data barrier instructions (e.g. fence) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

Hardware Performance Monitor registers are not implemented and hardwired to zero.

Updated to v0.2 specification (with clarification for mtvec access)

#### 1.16 Verification

All instructions have been extensively tested by Imperas, using tests generated specifically for this model and also reference tests from https://github.com/riscv/riscv-tests.

Also reference tests have been used from various sources including:

https://github.com/riscv/riscv-tests

https://github.com/ucb-bar/riscv-torture

The Imperas OVPsim RISC-V models are used in the RISC-V Foundation Compliance Framework as a functional Golden Reference:

https://github.com/riscv/riscv-compliance

where the simulated model is used to provide the reference signatures for compliance testing. The Imperas OVPsim RISC-V models are used as reference in both open source and commercial instruction stream test generators for hardware design verification, for example:

http://valtrix.in/sting from Valtrix

https://github.com/google/riscv-dv from Google

The Imperas OVPsim RISC-V models are also used by commercial and open source RISC-V Core RTL developers as a reference to ensure correct functionality of their IP.

### 1.17 References

The Model details are based upon the following specifications:

RISC-V Instruction Set Manual, Volume I: User-Level ISA (User Architecture Version 20191213)

RISC-V Instruction Set Manual, Volume II: Privileged Architecture (Privileged Architecture Version Ratified-IMFDQC-and-Priv-v1.11)

RISC-V External Debug Support (RISC-V External Debug Support Version 0.13.2-DRAFT)

## Openhwgroup-Specific Extensions

Open HW Group processors add various custom extensions to the basic RISC-V architecture. This model supports the following CORE-V Instruction Set Extensions:

- PULP\_XPULP Features
- Static 16 entry PMA
- Custom bus fault extensions
- Secure exceptions

The PULP\_CLUSTER and PULP\_ZFINX CORE-V Instruction Set Extensions are not supported, although the standard Risc-V Zfinx extension is supported in the base model.

In addition to the base model RISC-V parameters, this model implements parameters allowing openhwgroup-specific model features to be controlled. These parameters are documented below.

## 2.1 Parameter: extensions/PULP\_XPULP

The PULP\_XPULP CORE-V Instruction Set Extensions may be enabled on RV32 cores by setting the parameter extension/PULP\_XPULP to True.

Note that by default the XPULP instructions use the V2 conforming encodings that were defined in https://github.com/openhwgroup/cv32e40p/pull/704. The non-conforming V1 encodings that were previously implemented, may be selected by setting the parameter extension/PULP\_V1 to True.

### 2.2 PULP\_XPULP Extension Status

The XPULP extension is not enabled on this variant. Use parameter extension/PULP\_XPULP to enable it. To get additional info, set the parameter and re-generate the documentation.

## 2.3 PMA Extension Status

The PMA extension is not supported on this variant.

## 2.4 Custom Bus Fault Extension Status

The Custom Bus Fault extension is not supported on this variant.

## 2.5 Secure Exceptions Status

Secure Exceptions are not supported on this variant.

# Configuration

#### 3.1 Location

This model's VLNV is openhwgroup.ovpworld.org/processor/riscv/1.0.

The model source is usually at:

\$IMPERAS\_HOME/ImperasLib/source/openhwgroup.ovpworld.org/processor/riscv/1.0

The model binary is usually at:

\$IMPERAS\_HOME/lib/\$IMPERAS\_ARCH/ImperasLib/openhwgroup.ovpworld.org/processor/riscv/1.0

## 3.2 GDB Path

The default GDB for this model is: \$IMPERAS\_HOME/lib/\$IMPERAS\_ARCH/gdb/riscv-none-embed-gdb.

## 3.3 Semi-Host Library

The default semi-host library file is riscv.ovpworld.org/semihosting/pk/1.0

### 3.4 Processor Endian-ness

This is a LITTLE endian model.

## 3.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

#### 3.6 Processor ELF code

The ELF code supported by this model is: 0xf3.

# FIFO Ports

This model has no FIFO ports.

# Formal Parameters

Name	Type	Description
Fundamental		-
variant	Enumeration	Selects variant (either a generic UISA or a specific model)
user_version	Enumeration	Specify required User Architecture version (2.2, 2.3, 20190305 or 20191213)
priv_version	Enumeration	Specify required Privileged Architecture version (1.10, 1.11, 20190405, 20190608, 20211203, 1.12 or master)
endian	Endian	Model endian
enable_expanded	Boolean	Specify that 48-bit and 64-bit expanded instructions are supported
endianFixed	Boolean	Specify that data endianness is fixed (mstatus.{MBE,SBE,UBE} fields are read-only)
misa_MXL	Uns32	Override default value of misa.MXL
misa_Extensions	Uns32	Override default value of misa. Extensions
add_Extensions	String	Add extensions specified by letters to misa. Extensions (for example, specify "VD" to add V and D features)
sub_Extensions	String	Remove extensions specified by letters from misa. Extensions (for example, specify "VD" to remove V and D features)
misa_Extensions_mask	Uns32	Override mask of writable bits in misa. Extensions
add_Extensions_mask	String	Add extensions specified by letters to mask of writable bits in misa. Extensions (for example, specify "VD" to add V and D features)
sub_Extensions_mask	String	Remove extensions specified by letters from mask of writable bits in misa. Extensions (for example, specify "VD" to remove V and D features)
add_implicit_Extensions	String	Add extensions specified by letters to implicitly-present extensions not visible in misa. Extensions
sub_implicit_Extensions	String	Remove extensions specified by letters from implicitly-present extensions not visible in misa. Extensions
Compressed_Extension		
compress_version	Enumeration	Specify required Compressed Architecture version (legacy, 0.70.1, 0.70.5 or 1.0.0-RC5.7)
Zcea_version	Enumeration	Specify version of Zcea implemented (legacy only) (none or 0.50.1)
Zceb_version	Enumeration	Specify version of Zceb implemented (legacy only) (none or 0.50.1)
Zcee_version	Enumeration	Specify version of Zcee implemented (legacy only) (none or 1.0.0-rc)
Debug_Extension		
debug_version	Enumeration	Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE)
debug_mode	Enumeration	Specify how Debug mode is implemented (none, vector, interrupt or halt)
debug_address	Uns64	Specify address to which to jump to enter debug in vectored mode
dexc_address	Uns64	Specify address to which to jump on debug exception in vectored mode
debug_eret_mode	Enumeration	Specify behavior for MRET, SRET or URET in Debug mode (nop, jump to dexc_address or trap to dexc_address) (nop, jump_to_dexc_address or trap_to_dexc_address)

Interrupts Exceptions   Interrupts   Exceptions   Interrupts   Exceptions   Interrupts   Exceptions   Interrupts   Exceptions   Interrupts   Exceptions   Interrupts   Exceptions   Interrupts   Exceptions   Interrupts   Exceptions   Interrupts   Exceptions   Interrupts   Inter	debug-priority	Enumeration	Specify relative priorities of simultaneous debug events (original, PR693 or halt_not_step)

unaligned_low_pri  Boolean Specify whether address misaligned exceptions are lower priority than page or access fault exceptions  Boolean Specify whether the processor supports unaligned memory accesses  Instruction_CSR_Behavior  wfi_is_nop Boolean Specify whether WFI should be treated as a NOP (if not, halt while waiting for interrupts)  counteren_mask Uns32 Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers  noinhibit_mask Uns32 Specify hardware-enforced mask of always-zero bits in mcountinhibit register  mcycle_undefined Boolean Specify that the mcycle CSR is undefined  time_undefined Specify that the time CSR is undefined	Momory		name/-\mumber/
page or access fault exceptions  unaligned Boolean Specify whether the processor supports unaligned memory accesses  Instruction_CSR_Behavior  wfi_is_nop Boolean Specify whether WFI should be treated as a NOP (if not, halt while waiting for interrupts)  counteren_mask Uns32 Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers  noinhibit_mask Uns32 Specify hardware-enforced mask of always-zero bits in mcountinhibit register  mcycle_undefined Boolean Specify that the mcycle CSR is undefined  time_undefined Boolean Specify that the time CSR is undefined		Roclean	Specify whether address misslighed executions are lower priority than
Instruction_CSR_Behavior         wfi_is_nop       Boolean       Specify whether WFI should be treated as a NOP (if not, halt while waiting for interrupts)         counteren_mask       Uns32       Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers         noinhibit_mask       Uns32       Specify hardware-enforced mask of always-zero bits in mcountinhibit register         mcycle_undefined       Boolean       Specify that the mcycle CSR is undefined         time_undefined       Boolean       Specify that the time CSR is undefined	2		page or access fault exceptions
wfi_is_nop  Boolean Specify whether WFI should be treated as a NOP (if not, halt while waiting for interrupts)  Counteren_mask Uns32 Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers  Noinhibit_mask Uns32 Specify hardware-enforced mask of always-zero bits in mcountinhibit register  Mcycle_undefined Boolean Specify that the mcycle CSR is undefined  time_undefined Boolean Specify that the time CSR is undefined		Boolean	Specify whether the processor supports unaligned memory accesses
waiting for interrupts)  Counteren_mask  Uns32  Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers  Noinhibit_mask  Uns32  Specify hardware-enforced mask of always-zero bits in mcountinhibit register  mcycle_undefined  Boolean  Specify that the mcycle CSR is undefined  time_undefined  Boolean  Specify that the time CSR is undefined			
counteren_mask  Uns32 Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers  noinhibit_mask  Uns32 Specify hardware-enforced mask of always-zero bits in mcountinhibit register  mcycle_undefined  Boolean Specify that the mcycle CSR is undefined  time_undefined  Boolean Specify that the time CSR is undefined	wfi_is_nop	Boolean	Specify whether WFI should be treated as a NOP (if not, halt while waiting for interrupts)
noinhibit_mask Uns32 Specify hardware-enforced mask of always-zero bits in mcountinhibit register mcycle_undefined Boolean Specify that the mcycle CSR is undefined time_undefined Boolean Specify that the time CSR is undefined	counteren_mask	Uns32	Specify hardware-enforced mask of writable bits in mcounteren/scoun-
mcycle_undefined Boolean Specify that the mcycle CSR is undefined time_undefined Boolean Specify that the time CSR is undefined	noinhibit_mask	Uns32	Specify hardware-enforced mask of always-zero bits in mcountinhibit reg-
time_undefined Boolean Specify that the time CSR is undefined	mcycle undefined	Boolean	
minstret_undefined Boolean Specify that the minstret CSR is undefined	minstret_undefined		Specify that the time CSR is undefined  Specify that the minstret CSR is undefined

mhpmcounter_undefined	Boolean	Specify that the mhpmcounter CSRs are undefined
CSR_Masks		A V A
mtvec_mask	Uns64	Specify hardware-enforced mask of writable bits in mtvec register
tdata1_mask	Uns64	Specify hardware-enforced mask of writable bits in Trigger Module tdata1
		register
mip_mask	Uns64	Specify hardware-enforced mask of writable bits in mip register
mtvec_sext	Boolean	Specify whether mtvec is sign-extended from most-significant bit
Trigger		
tinfo_undefined	Boolean	Specify that the tinfo CSR is undefined
tcontrol_undefined	Boolean	Specify that the tcontrol CSR is undefined
mcontext_undefined	Boolean	Specify that the mcontext CSR is undefined
scontext_undefined	Boolean	Specify that the scontext CSR is undefined
mscontext_undefined	Boolean	Specify that the mscontext CSR is undefined (Debug Version 0.14.0 and
		later)
amo_trigger	Boolean	Specify whether AMO load/store operations activate triggers
no_hit	Boolean	Specify that tdata1.hit is unimplemented
trigger_num	Uns32	Specify the number of implemented hardware triggers
tinfo	Uns32	Override tinfo register (for all triggers)
trigger_match	Uns32	Specify legal "match" values for triggers of type 2 and 6 (bitmask)
mcontext_bits	Uns32	Specify the number of implemented bits in moontext
mvalue_bits	Uns32	Specify the number of implemented bits in textra.mvalue (if zero, tex-
		tra.mselect is tied to zero)
mcontrol_maskmax	Uns32	Specify mcontrol.maskmax value
PMP Configuration		I U
PMP_grain	Uns32	Specify PMP region granularity, G (0 =>4 bytes, 1 =>8 bytes, etc)
PMP_registers	Uns32	Specify the number of implemented PMP address registers
PMP_max_page	Uns32	Specify the maximum size of PMP region to map if non-zero (may improve
1 0		performance; constrained to a power of two)
PMP_decompose	Boolean	Whether unaligned PMP accesses are decomposed into separate aligned
•		accesses
PMP_undefined	Boolean	Whether accesses to unimplemented PMP registers are undefined (if
		True) or write ignored and zero (if False)
PMP_maskparams	Boolean	Enable parameters to change the read-only masks for PMP CSRs
PMP_initialparams	Boolean	Enable parameters to change the reset values for PMP CSRs
Other_Extensions		
Smstateen	Boolean	Specify that Smstateen is implemented
Zicsr	Boolean	Specify that Zicsr is implemented
Zifencei	Boolean	Specify that Zifencei is implemented
Zicbom	Boolean	Specify that Zicbom is implemented
Zicbop	Boolean	Specify that Zicbop is implemented
Zicboz	Boolean	Specify that Zicboz is implemented
Zmmul	Boolean	Specify that Zmmul is implemented
$CSR\_Defaults$		
mvendorid	Uns64	Override mvendorid register
marchid	Uns64	Override marchid register
mimpid	Uns64	Override mimpid register
mhartid	Uns64	Override mhartid register (or first mhartid of an incrementing sequence
		if this is an SMP variant)
mtvec	Uns64	Override mtvec register
Fast_Interrupt		
CLICLEVELS	Uns32	Specify number of interrupt levels implemented by CLIC, or 0 if CLIC
		absent
AIA_Interrupts		
Smaia	Boolean	Specify that Smaia CSRs are present

Table 9.1: Parameters that can be set in: Hart

### 9.1 Extension Parameters

Name	Type	Description
debug	Boolean	debug flags
mcountinhibit_reset	Uns32	reset value of mcountinhibit
PULP_XPULP	Boolean	Enable XPULP features (CORE-V Extensions, excluding cv.elw
PULP_V1	Boolean	Enable obsolete V1 encodings for PULP opcodes
PULP_V2	Boolean	Enable current V2 encodings for PULP opcodes (default if neither PULP_V1
		or PULP_V2 are specified

Table 9.2: Parameters for extension

## 9.2 Parameters with enumerated types

#### 9.2.1 Parameter user\_version

Set to this value	Description
2.2	User Architecture Version 2.2
2.3	Deprecated and equivalent to 20191213
20190305	Deprecated and equivalent to 20191213
20191213	User Architecture Version 20191213

Table 9.3: Values for Parameter user\_version

### 9.2.2 Parameter priv\_version

Set to this value	Description
1.10	Privileged Architecture Version 1.10
1.11	Privileged Architecture Version 1.11, equivalent to 20190608
20190405	Deprecated and equivalent to 20190608
20190608	Privileged Architecture Version Ratified-IMFDQC-and-Priv-v1.11
20211203	Privileged Architecture Version 20211203
1.12	Privileged Architecture Version 1.12, equivalent to 20211203
master	Privileged Architecture Master Branch as of commit 6bdeb58 (this is subject to change)

Table 9.4: Values for Parameter priv\_version

### 9.2.3 Parameter compress\_version

Set to this value	Description	
legacy	Compressed Architecture absent or legacy version	
0.70.1	Compressed Architecture Version 0.70.1	
0.70.5	Compressed Architecture Version 0.70.5	
1.0.0-RC5.7	Compressed Architecture Version 1.0.0-RC5.7	

Table 9.5: Values for Parameter compress\_version

### 9.2.4 Parameter debug\_version

Set to this value	Description	
0.13.2-DRAFT	RISC-V External Debug Support Version 0.13.2-DRAFT	
0.14.0-DRAFT	RISC-V External Debug Support Version 0.14.0-DRAFT	

1.0.0-STABLE	RISC-V External Debug Support Version 1.0.0-STABLE

Table 9.6: Values for Parameter debug\_version

#### 9.2.5 Parameter rnmi\_version

Set to this value	Description
none	RNMI not implemented
0.2.1	RNMI version 0.2.1
0.4	RNMI version 0.4

Table 9.7: Values for Parameter rnmi\_version

### 9.2.6 Parameter debug\_mode

Set to this value	Description	
none	Debug mode not implemented	
vector	Debug mode implemented by execution at vector	
interrupt	Debug mode implemented by interrupt	
halt	Debug mode implemented by halt	

Table 9.8: Values for Parameter debug\_mode

### 9.2.7 Parameter debug\_eret\_mode

Set to this value	Description
nop	MRET, SRET or URET in Debug mode is a nop
jump_to_dexc_address	MRET, SRET or URET in Debug mode jumps to dexc_address
trap_to_dexc_address	MRET, SRET or URET in Debug mode traps to dexc_address

Table 9.9: Values for Parameter debug\_eret\_mode

### 9.2.8 Parameter debug\_priority

Set to this value	Description	
original	original debug priorities	
PR693	priorities described specification PR 693	
halt_not_step	treat haltreq as higher priority to step	

Table 9.10: Values for Parameter debug\_priority

#### 9.2.9 Parameter Zcea\_version

Set to this value	Description
none	Zcea not implemented
0.50.1	Zcea version 0.50.1

Table 9.11: Values for Parameter Zcea\_version

#### 9.2.10 Parameter Zceb\_version

Set to this value	Description
none	Zceb not implemented
0.50.1	Zceb version 0.50.1

Table 9.12: Values for Parameter Zceb\_version

### 9.2.11 Parameter Zcee\_version

Set to this value	Description
none	Zcee not implemented
1.0.0-rc	Zcee version 1.0.0-rc

Table 9.13: Values for Parameter Zcee\_version

# **Execution Modes**

Mode	Code	Description				
Machine	3	Machine mode				
Debug	6	Debug mode				

Table 10.1: Modes implemented in: Hart

# Exceptions

Exception	Code	Description
InstructionAddressMisaligned	0	Fetch from unaligned address
InstructionAccessFault	1	No access permission for fetch
IllegalInstruction	2	Undecoded, unimplemented or disabled instruc-
		tion
Breakpoint	3	EBREAK instruction executed
LoadAddressMisaligned	4	Load from unaligned address
LoadAccessFault	5	No access permission for load
StoreAMOAddressMisaligned	6	Store/atomic memory operation at unaligned
		address
StoreAMOAccessFault	7	No access permission for store/atomic memory
		operation
EnvironmentCallFromMMode	11	ECALL instruction executed in Machine mode
InstructionPageFault	12	Page fault at fetch address
LoadPageFault	13	Page fault at load address
StoreAMOPageFault	15	Page fault at store/atomic memory operation
		address
MSWInterrupt	67	Machine software interrupt
MTimerInterrupt	71	Machine timer interrupt
MExternalInterrupt	75	Machine external interrupt
LocalInterrupt0	80	Local interrupt 0 (id 16)
LocalInterrupt1	81	Local interrupt 1 (id 17)
LocalInterrupt2	82	Local interrupt 2 (id 18)
LocalInterrupt3	83	Local interrupt 3 (id 19)
LocalInterrupt4	84	Local interrupt 4 (id 20)
LocalInterrupt5	85	Local interrupt 5 (id 21)
LocalInterrupt6	86	Local interrupt 6 (id 22)
LocalInterrupt7	87	Local interrupt 7 (id 23)
LocalInterrupt8	88	Local interrupt 8 (id 24)
LocalInterrupt9	89	Local interrupt 9 (id 25)
LocalInterrupt10	90	Local interrupt 10 (id 26)
LocalInterrupt11	91	Local interrupt 11 (id 27)
LocalInterrupt12	92	Local interrupt 12 (id 28)

LocalInterrupt13	93	Local interrupt 13 (id 29)
LocalInterrupt14	94	Local interrupt 14 (id 30)
LocalInterrupt15	95	Local interrupt 15 (id 31)

Table 11.1: Exceptions implemented in: Hart

## Hierarchy of the model

A CPU core may be configured to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy. Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

#### 12.1 Level 1: Hart

This level in the model hierarchy has 5 commands.

This level in the model hierarchy has 3 register groups:

Group name	Registers
Core	33
Machine_Control_and_Status	180
Integration_support	3

Table 12.1: Register groups

This level in the model hierarchy has no children.

### **Model Commands**

A Processor model can implement one or more **Model Commands** available to be invoked from the simulator command line, from the OP API or from the Imperas Multiprocessor Debugger.

#### 13.1 Level 1: Hart

#### 13.1.1 debugflags

show or modify the processor debug flags

Argument	Type	Description	
-get	Boolean	print current processor flags value	
-mask	Boolean	print valid debug flag bits	
-set	Int32	new processor flags (only flags 0x00000006 can	
		be modified)	

Table 13.1: debugflags command arguments

#### 13.1.2 getCSRIndex

Return index for a named CSR (or -1 if no matching CSR)

Argument	Type	Description
-name	String	CSR name

Table 13.2: getCSRIndex command arguments

#### 13.1.3 isync

specify instruction address range for synchronous execution

Argument	Type	Description	
-addresshi	Uns64	end address of synchronous execution range	
-addresslo	Uns64	start address of synchronous execution range	

Table 13.3: isync command arguments

#### 13.1.4 itrace

enable or disable instruction tracing

Argument	Type	Description
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing
-instructioncount	Boolean	include the instruction number in each trace
-memory	String	show memory accesses by this instruction. Ar-
		gument can be any combination of X (execute),
		A (load or store access) and S (system)
-mode	Boolean	show processor mode changes
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-processorname	Boolean	Include processor name in all trace lines
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

Table 13.4: itrace command arguments

#### 13.1.5 listCSRs

#### 13.1.5.1 Argument description

List all CSRs in index order

# Registers

### 14.1 Level 1: Hart

#### 14.1.1 Core

Registers at level:1, type:Hart group:Core
